

What are the checks you can perform with Spine 3D?

The checks you can carry out are many, starting from the possibility of being able to refine an accurate diagnostic hypothesis (before undergoing an invasive examination, which may not be necessary or not suitable for a correct view of the problem). You can check for scoliosis (a problem that occurs most frequently during puberty or the menopause), a curved back, a sloping pelvis or even severe osteoporosis. Of course you can also be checked after a very strong trauma (car accident or accident – private or at work), in case of suspected lithiasis or for particular cervical problems, examinations which usually take place by means of magnetic resonance imaging and which you can now carry out in the first instance in a non-invasive and completely safe manner.

Don't ignore your body's signal

Remember, it is important to take care of our own health and that of our children. That's why the advice is always to not neglect the signals our bodies send. A simple backache could conceal problems that if neglected could lead to unpleasant complications. A preventive examination not only helps us to define the problem, but also allows a specialist to make a correct diagnosis and perfect an effective improvement path.

Spine 3d was created with the desire to make your diagnostic pathway safe.

Non-invasive and safe scoliosis test

Do you have back pain? Do you want to have your baby examined for scoliosis? Are you pregnant and don't want to undergo invasive checks? Do you afraid of radiological instruments? Are you recovering from an injury and need regular check-ups? Do you have a sedentary job and back pain is becoming more and more unbearable every day?

Spine 3D has arrived, an innovative, non-invasive, three-dimensional detection system. It allows an accurate assessment of the spine. As a result any reason of the back pain can be detected fast and easy.

safe and accurate test

Spine 3D is not a substitute for normal diagnostic imaging, but it is very useful for control or follow-up examinations. Because there is no such risk as a traditional radiological examination. It is a tool suitable for everyone's needs: children, pregnant mothers, sportsmen and women, and the frail. Accurate assesment of the spine and scoliosis has never been easier! Why undergo a CT (Computed Axial Tomography) scan or an MRI when an initial assessment can be done non-invasively? Even a normal X-ray can sometimes be too much, if there is a different way to accurately "read" the state of our health. Spine 3D is designed to meet your needs, so that you can carry out all the necessary checks in complete safety. Because checking your health should never be a problem, but a solution. And with the new Sensor Medica technology it is now easier and safer than ever.
